

# Antidepressant crosstaper matrix

FROM and TO with method, overlap, and watchouts. Plus MAOI washout rules. Reviewed against current guidelines as of June 8, 2026.

Three patterns cover almost every antidepressant switch. Direct switch (stop one, start the next day). Cross-taper (overlap with opposite dose adjustments). Wash and switch (fully discontinue, then start). Default when unsure: cross-taper over 1 to 2 weeks. It's rarely wrong.

## The switching matrix

| FROM       | TO             | Method                      | Overlap approach                                   | Watchouts                                      |
|------------|----------------|-----------------------------|----------------------------------------------------|------------------------------------------------|
| SSRI       | Different SSRI | Direct or short cross-taper | Same day or 3 to 7 day overlap                     | Watch for serotonin syndrome if both high dose |
| SSRI       | SNRI           | Direct or short cross-taper | 3 to 7 days at reduced doses                       | Blood pressure at SNRI titration               |
| SSRI       | Bupropion      | Cross-taper or wash         | Bupropion starts after SSRI reduced                | Anxiety re-emergence with bupropion            |
| SSRI       | Mirtazapine    | Direct or overlap           | Overlap safe (California rocket fuel evidence)     | Sedation, weight                               |
| SSRI       | TCA            | Cross-taper                 | Fluoxetine and paroxetine raise TCA levels via 2D6 | TCA levels can rise sharply                    |
| SSRI       | MAOI           | Wash                        | 14 days (5 weeks for fluoxetine)                   | Serotonin syndrome                             |
| SSRI       | Vortioxetine   | Direct or short cross-taper | 3 to 7 day overlap                                 | Nausea common                                  |
| SNRI       | SSRI           | Cross-taper                 | 1 to 2 weeks (venlafaxine discontinuation)         | Discontinuation from venlafaxine, duloxetine   |
| SNRI       | Different SNRI | Direct if equipotent        | Venlafaxine to duloxetine: usually direct          | Watch BP                                       |
| SNRI       | Bupropion      | Cross-taper                 | Reduce SNRI first                                  | Venlafaxine discontinuation                    |
| SNRI       | Mirtazapine    | Direct or overlap           | Overlap safe                                       | Sedation                                       |
| SNRI       | MAOI           | Wash                        | 14 days                                            | Serotonin syndrome                             |
| Paroxetine | Anything       | Cross-taper, slowly         | Reduce paroxetine over 2 to 4 weeks                | Severe discontinuation syndrome                |
| Fluoxetine | Anything       | Direct or short cross-taper | Self-tapers due to long half-life                  | 5-week wait before MAOI; 2D6 lingers           |

|              |                                       |                         |                                              |                                            |
|--------------|---------------------------------------|-------------------------|----------------------------------------------|--------------------------------------------|
| Fluoxetine   | Fast 2D6 substrate (TCA, atomoxetine) | Cross-taper carefully   | 2D6 inhibition persists weeks after stopping | Watch TCA or atomoxetine levels            |
| TCA          | SSRI                                  | Cross-taper             | Reduce TCA over 1 to 2 weeks                 | Fluoxetine or paroxetine raise TCA via 2D6 |
| TCA          | MAOI                                  | Wash                    | 14 days                                      | Serotonin syndrome, hypertensive crisis    |
| Bupropion    | Anything                              | Direct                  | Bupropion has minimal discontinuation issues | Anxiety re-emergence if it was covering    |
| Mirtazapine  | Anything                              | Direct or overlap       | Easy to overlap safely                       | Sedation carry-over if abrupt              |
| MAOI         | Anything serotonergic                 | Wash                    | 14 days                                      | Serotonin syndrome                         |
| MAOI         | Different MAOI                        | Wash                    | 14 days (enzyme regeneration)                |                                            |
| Vortioxetine | SSRI or SNRI                          | Direct or short overlap | Vortioxetine half-life 66 hours              | Nausea if incoming drug titrated fast      |
| Vilazodone   | SSRI                                  | Direct                  | Vilazodone half-life 25 hours                | Take with food matters for vilazodone      |

## MAOI washout rules

| Direction                                                                    | Rule                                                              |
|------------------------------------------------------------------------------|-------------------------------------------------------------------|
| Before starting an MAOI, after stopping most SSRIs, SNRIs, TCAs, mirtazapine | Wait 14 days                                                      |
| Before starting an MAOI, after stopping fluoxetine                           | Wait 5 weeks (norfluoxetine t1/2 7 to 15 days)                    |
| Before starting an MAOI, after stopping another MAOI                         | Wait 14 days (enzyme regeneration)                                |
| Before starting an MAOI, after stopping bupropion                            | At least 24 hours; some sources 14 days                           |
| Never combine with an active MAOI                                            | Meperidine, tramadol, dextromethorphan, linezolid, methylene blue |
| Before starting a serotonergic drug after an MAOI                            | Wait 14 days after last MAOI dose                                 |
| Selegiline transdermal 6 mg per 24 hr                                        | No dietary restrictions, but same 14-day washouts apply           |

## Special cases worth calling out

- Paroxetine to anything. Discontinuation is intense: nausea, dizziness, brain zaps, flu-like symptoms. Cross-taper over 2 to 4 weeks. Consider liquid formulation at the low end. If incoming drug is bupropion, expect discontinuation to happen even during overlap.
- Venlafaxine to duloxetine. Usually direct: venlafaxine 150 XR to duloxetine 60 next day. Watch BP.
- TCA to fluoxetine or paroxetine. 2D6 inhibition raises TCA levels 2 to 4-fold. Check a level first, reduce TCA meaningfully, or pick sertraline, citalopram, or escitalopram.

- Serotonin syndrome risk during overlap. At typical doses, well-tolerated. Warning signs: agitation, diaphoresis, hyperreflexia, clonus (especially lower extremity), tremor, tachycardia, GI symptoms. If clonus, temp over 38C, or altered mental status: stop both and treat.
